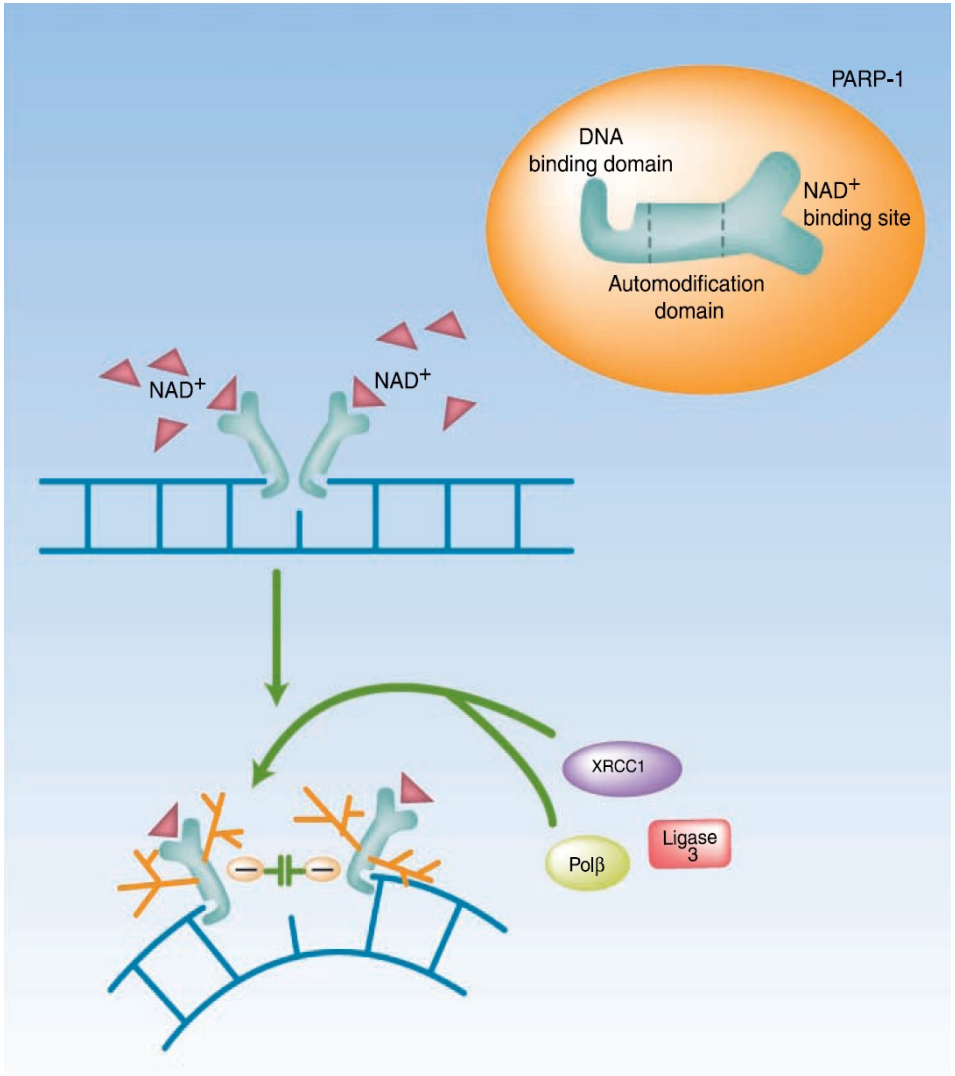
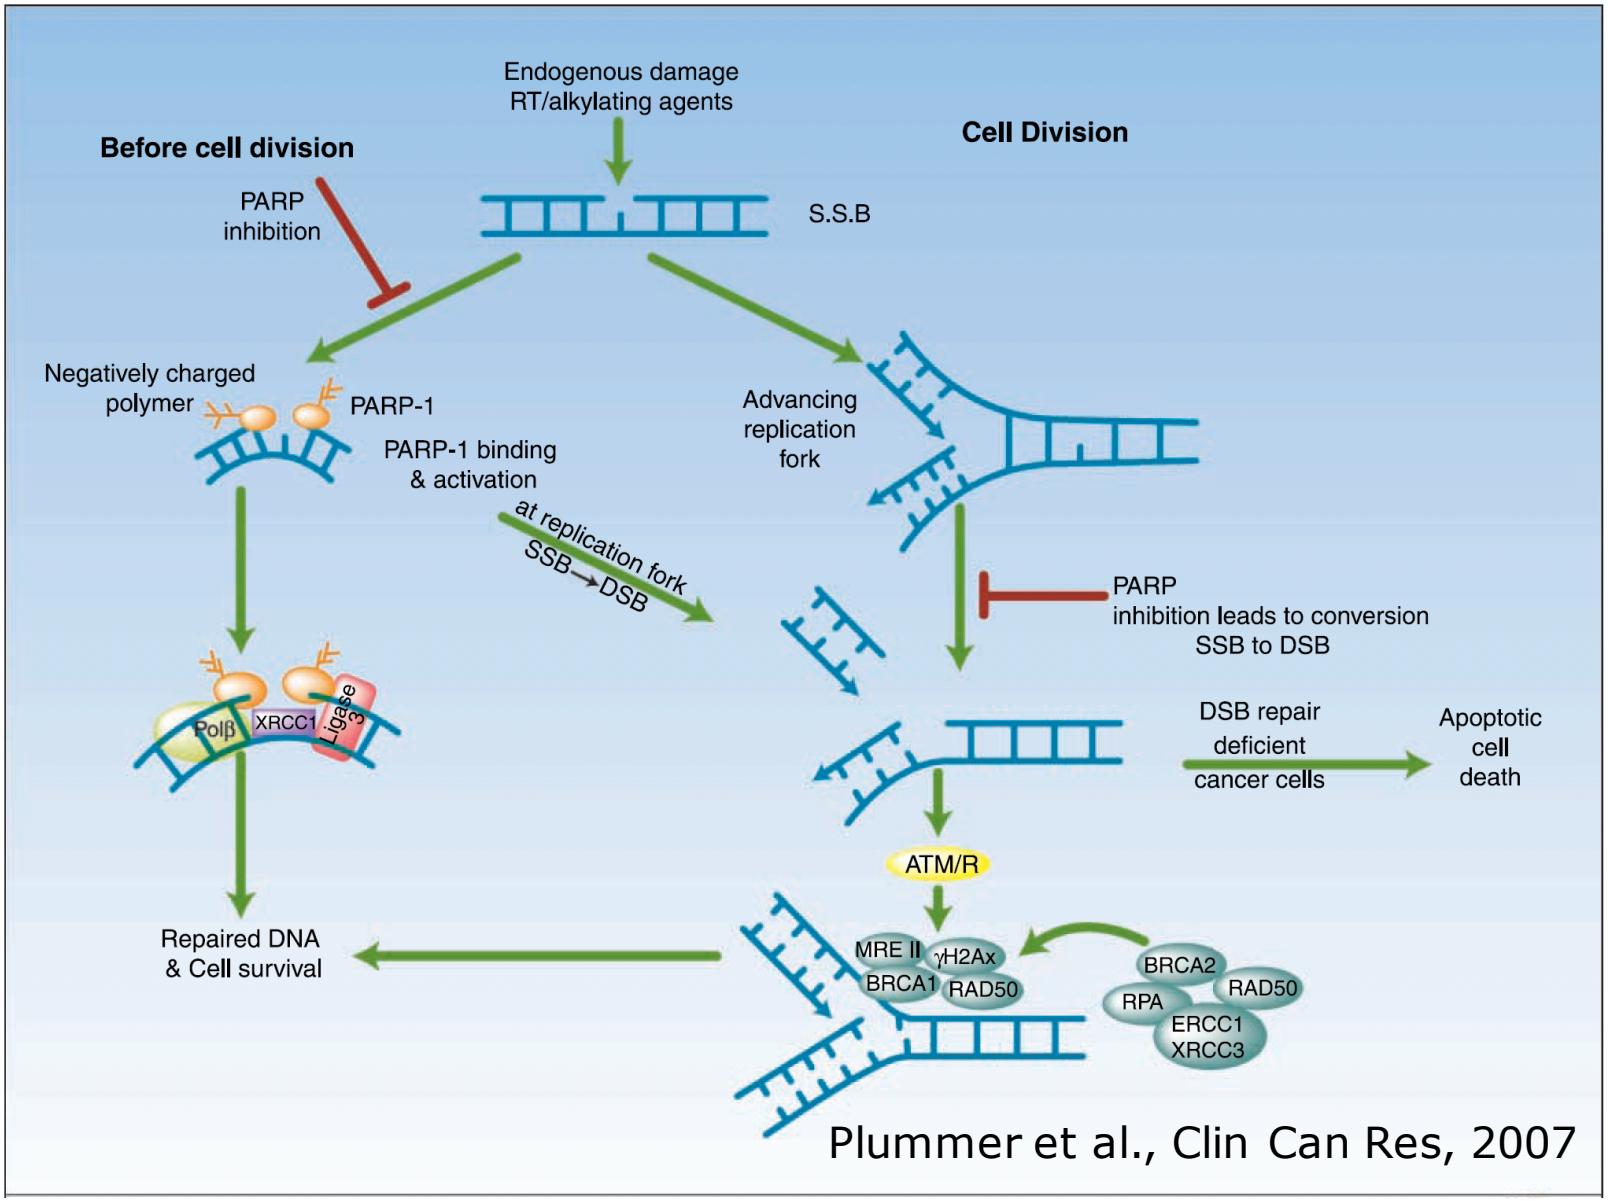
Base Excision Repair via PARP



Plummer et al., Clin Can Res, 2007

PARP Function in DNA Repair

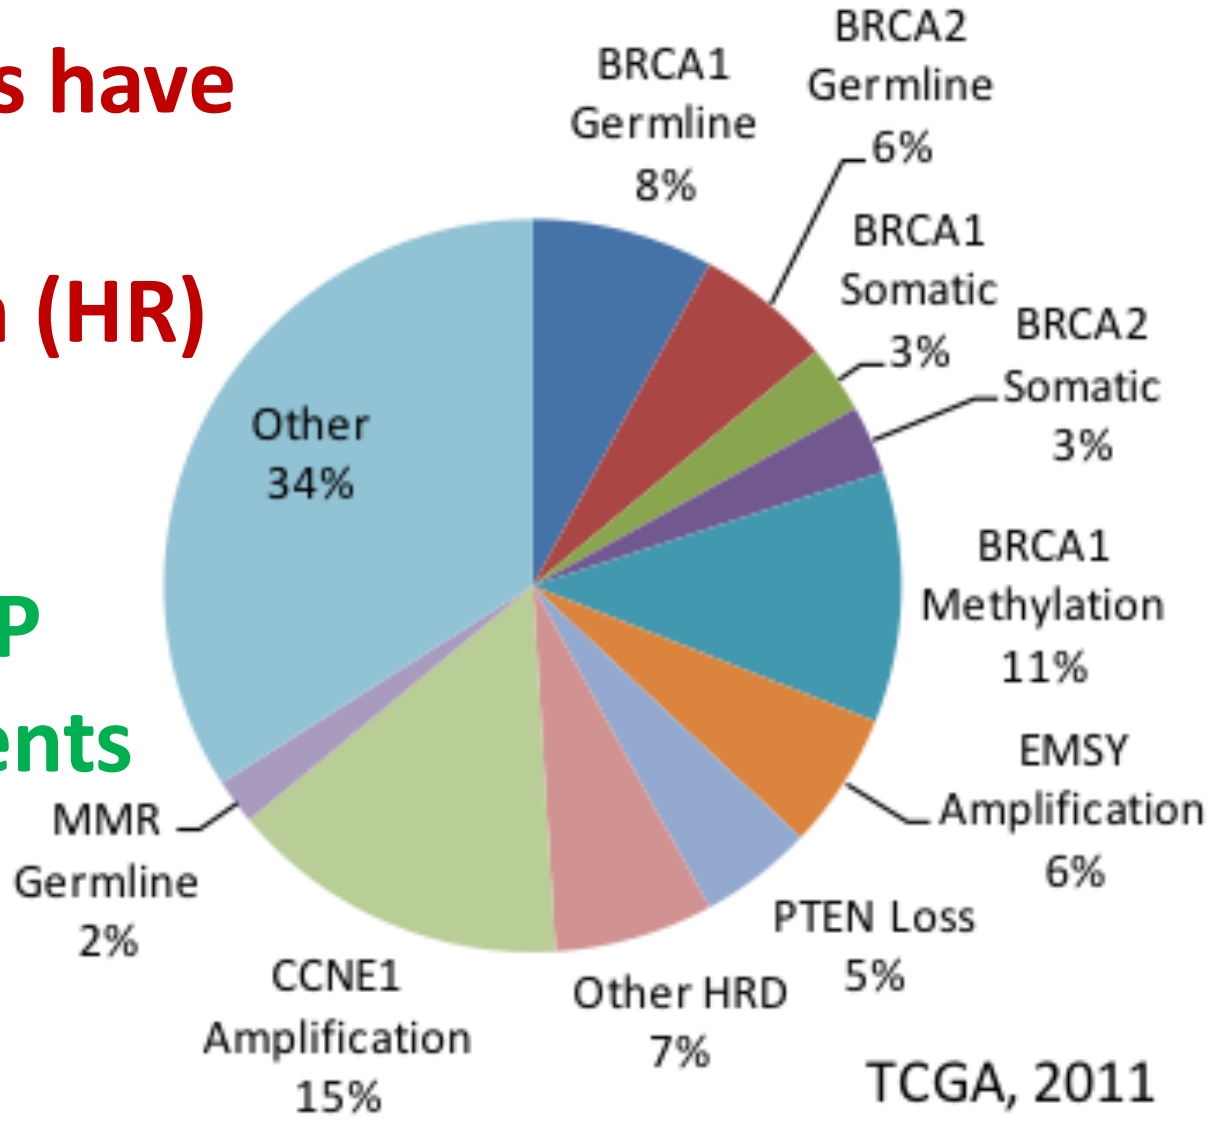


Plummer et al., Clin Can Res, 2007

The Era of PARP inhibitors

~40% of HGSCs have homologous recombination (HR) defect

Inhibiting PARP for those patients



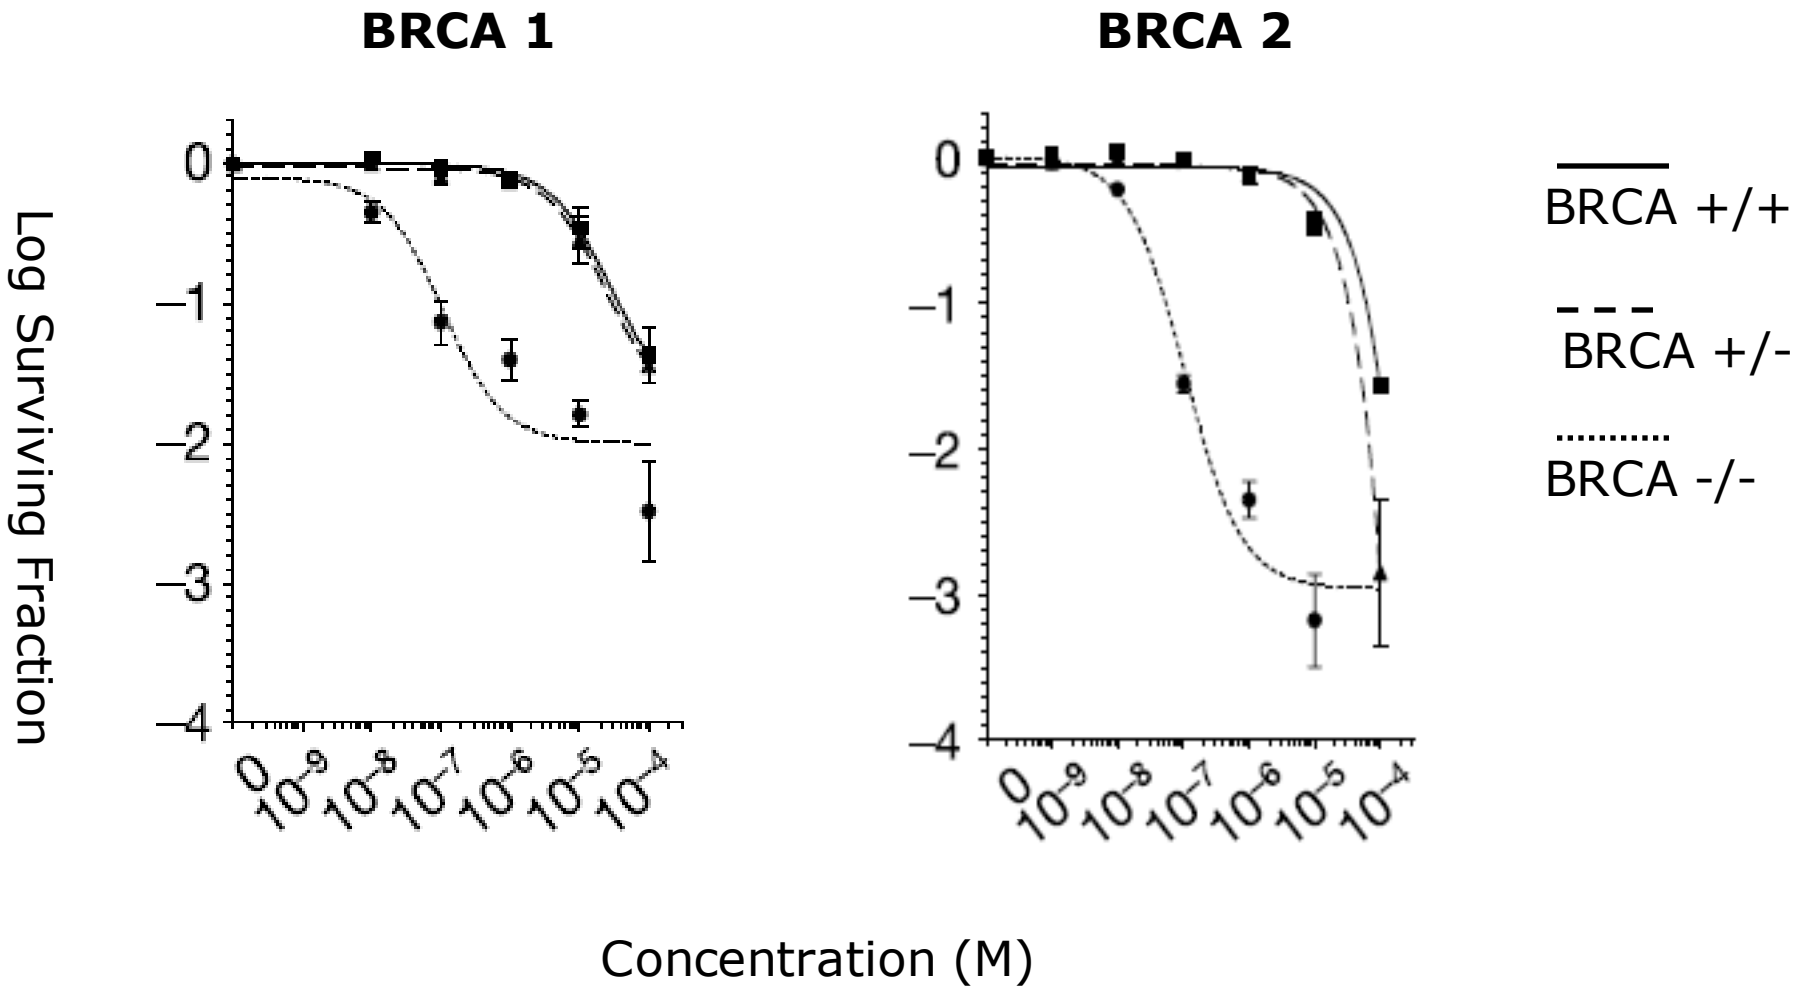
Rationale Behind PARP Inhibition

- BRCA Negative (and HR deficient) Tumors
  - Unable to repair double strand DNA breaks using homologous recombination
  - Rely upon PARP to repair single-strand breaks and replication fork stalls
- In Combination with Chemotherapy
  - Chemotherapies cause DNA single strand breaks
  - Inhibition of PARP will not allow single strand repair at these sites

Olaparib FDA Approval

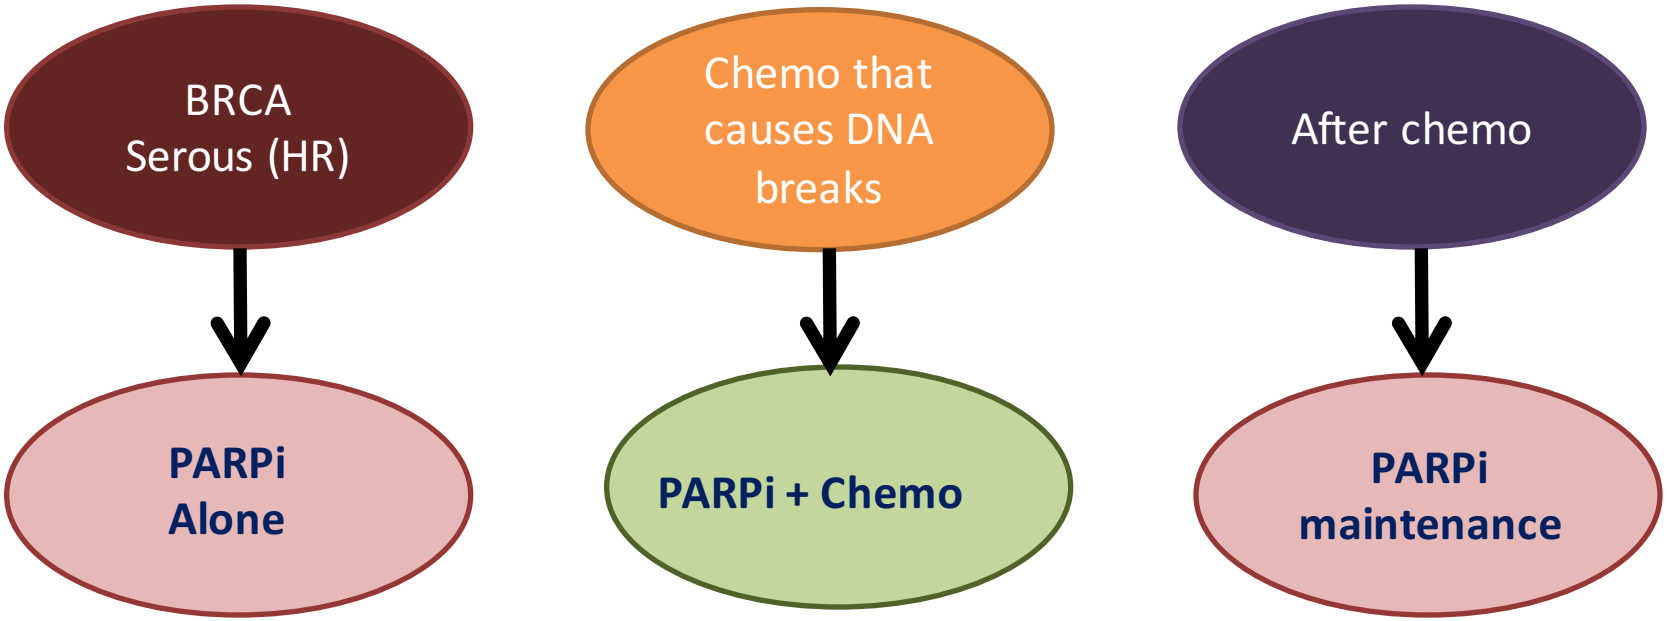
- December 2014
- Patients
  - Germline *BRCA 1/2* mutation
  - ≥ 3 prior lines of therapy
- Basis of Approval
  - 34% ORR in 137 patients
  - Duration of response 7.9 months
- **Is this advancing care or an option of care?**

PARP Inhibitors Selectively Kill BRCA Deficient Tumor Cells



Farmer et al., Nature 2005

CLINICAL TRIAL DESIGNS

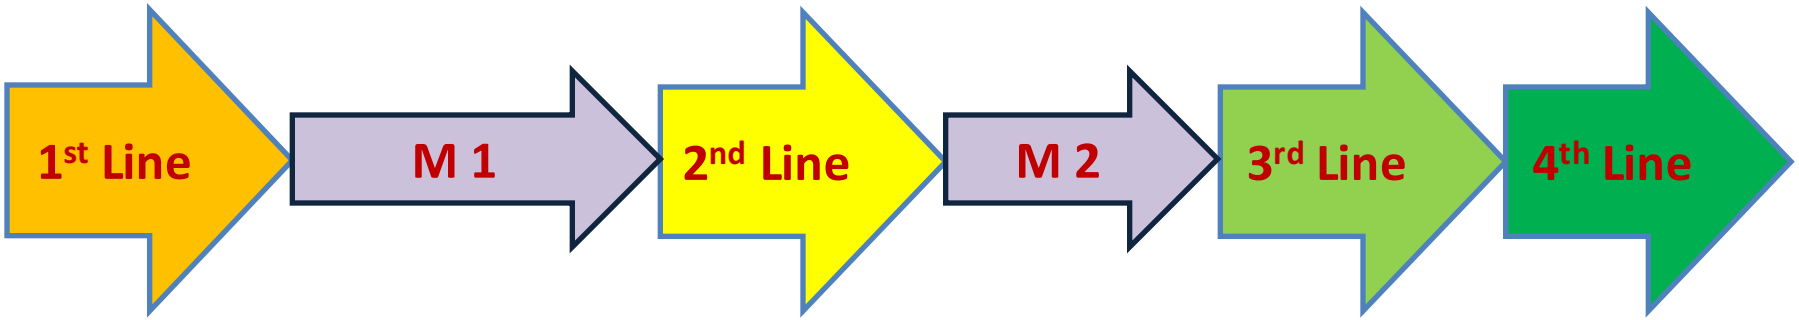


PARP Inhibitors in Clinical Trials with Registration Potential

Drug	Trial	Phase	Design
Olaparib (AZD2281)	SOLO 1	3	Maintenance – following front line treatment, germline and somatic BRCA
	SOLO 2	3	Maintenance – following platinum combination therapy for platinum sensitive recurrence, germline and somatic BRCA
	SOLO 3	3	Treatment – monotherapy/standard chemotherapy for platinum sensitive recurrence, germline BRCA
Niraparib (MK4827)	NOVA	3	Maintenance – following platinum combination therapy for platinum sensitive recurrence, germline BRCA or high grade serous
	QUADRA	2	Treatment – ≥ 3 priors, high grade serous
Rucaparib (CO-338)	ARIEL 3	3	Maintenance – following platinum combination therapy for platinum sensitive recurrence, high grade serous or endometrioid
	ARIEL 2	2	Treatment – 3/4 priors, high grade serous or endometrioid
Veliparib (ABT888)	GOG 3005	3	Treatment – first line with chemotherapy

https://clinicaltrials.gov

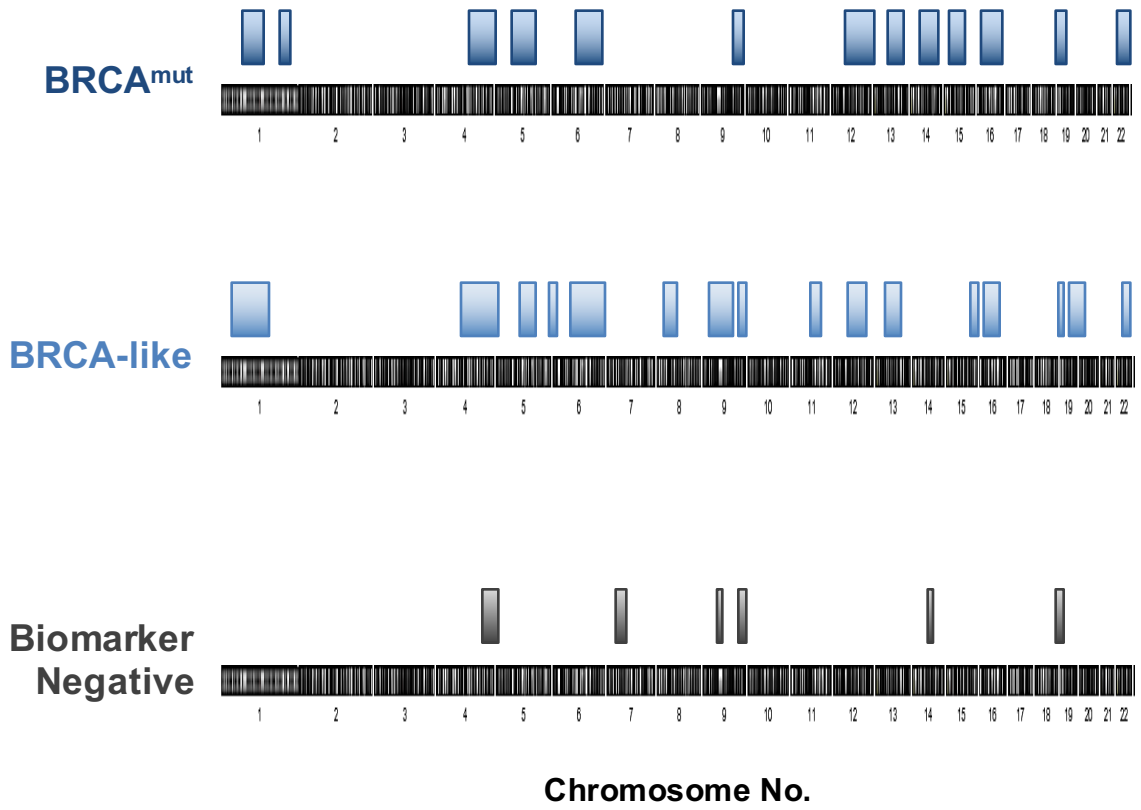
When to Use a PARP Inhibitor?



4th Line (or beyond?)

- ≥ 3 lines of chemotherapy = "unmet medical need" by FDA
- Response rate data led to olaparib accelerated approval in germline BRCA patients (December 2014).
- Niraparib and rucaparib phase 2 studies opened in January 2015
- Phase 2 study of liposomal doxorubicin vs. olaparib failed to show superiority of olaparib. Will SOLO 3 succeed?
- More work is needed to discern who will really benefit.

HRD causes genome-wide loss of heterozygosity (LOH) that can be measured by comprehensive genomic profiling based on NGS



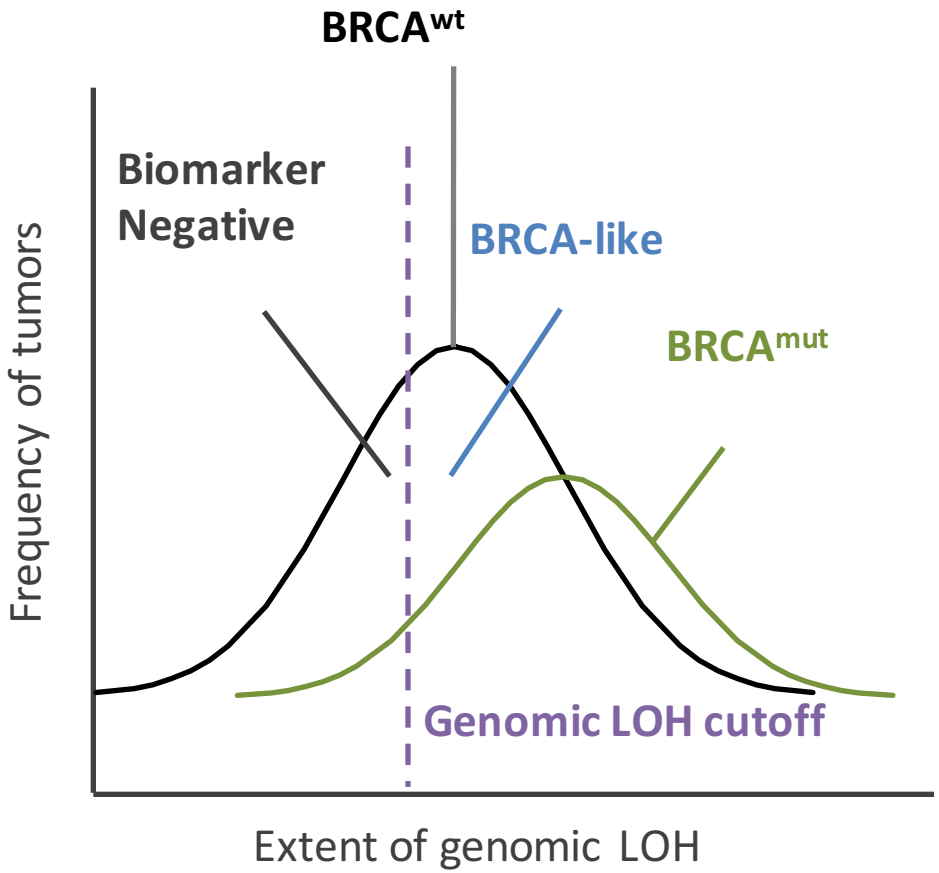
Hypothesis 1:
Ovarian cancer patients with high genomic LOH suggesting BRCA-like signature will respond to PARPi.

Hypothesis 2:
Ovarian cancer patients who are "biomarker negative" (ie, with low genomic LOH) will not respond to PARPi.

NGS=next-generation sequencing; mut=mutation; wt=wild type.

McNeish et al., ASCO 2015

HGOC patients can be classified into three molecular subgroups: BRCA^{mut}, BRCA-like, Biomarker Negative



McNeish et al., ASCO 2015

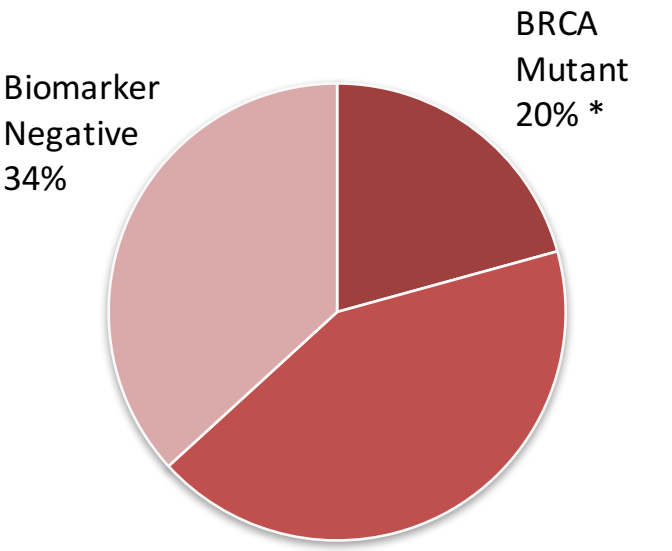
Patient characteristics

Parameter	Total (N=204)
Median age, years (range)	65 (31–86)
ECOG PS grade	
0 / 1 / Pending (%)	67 / 30 / 3
Diagnosis	
Epithelial ovarian cancer (%)	80
Primary peritoneal / fallopian tube cancer (%)	12 / 7 (1 UNK)
Histology	
Serous / endometrioid / mixed/ pending (%)	96 / 2 / 2 / 1
No. of prior treatment regimens	
Median no. of regimens (range)	1 (1–6)
1–2 (%)	81
>2 (%)	19
Median no. of plat-based regimens (range)	1 (1–5)
1–2 (%)	86%
>2 (%)	14

UNK – unknown

Data cut 01APR2015

Distribution of HRD molecular subgroups (N=191)



* Enrollment of known gBRCA patients was capped

McNeish et al., ASCO 2015

BRCA^{wt} patients can be split into 2 subgroups with enhanced benefit observed in BRCA-like tumors

HRD Subgroup	Median PFS (mo) [90% CI]	Overall Response Rate, % (N)	
		RECIST	RECIST + CA-125
BRCA^{mut}	9.4 [7.3, NR]	69 (27/39)	82 (32/39)
BRCA-like	7.1 [3.7, 10.8]	30 (22/74)	45 (33/74)
Biomarker negative	3.7 [3.5, 5.5]	13 (8/62)	21 (13/62)

NR – not reached

McNeish et al., ASCO 2015

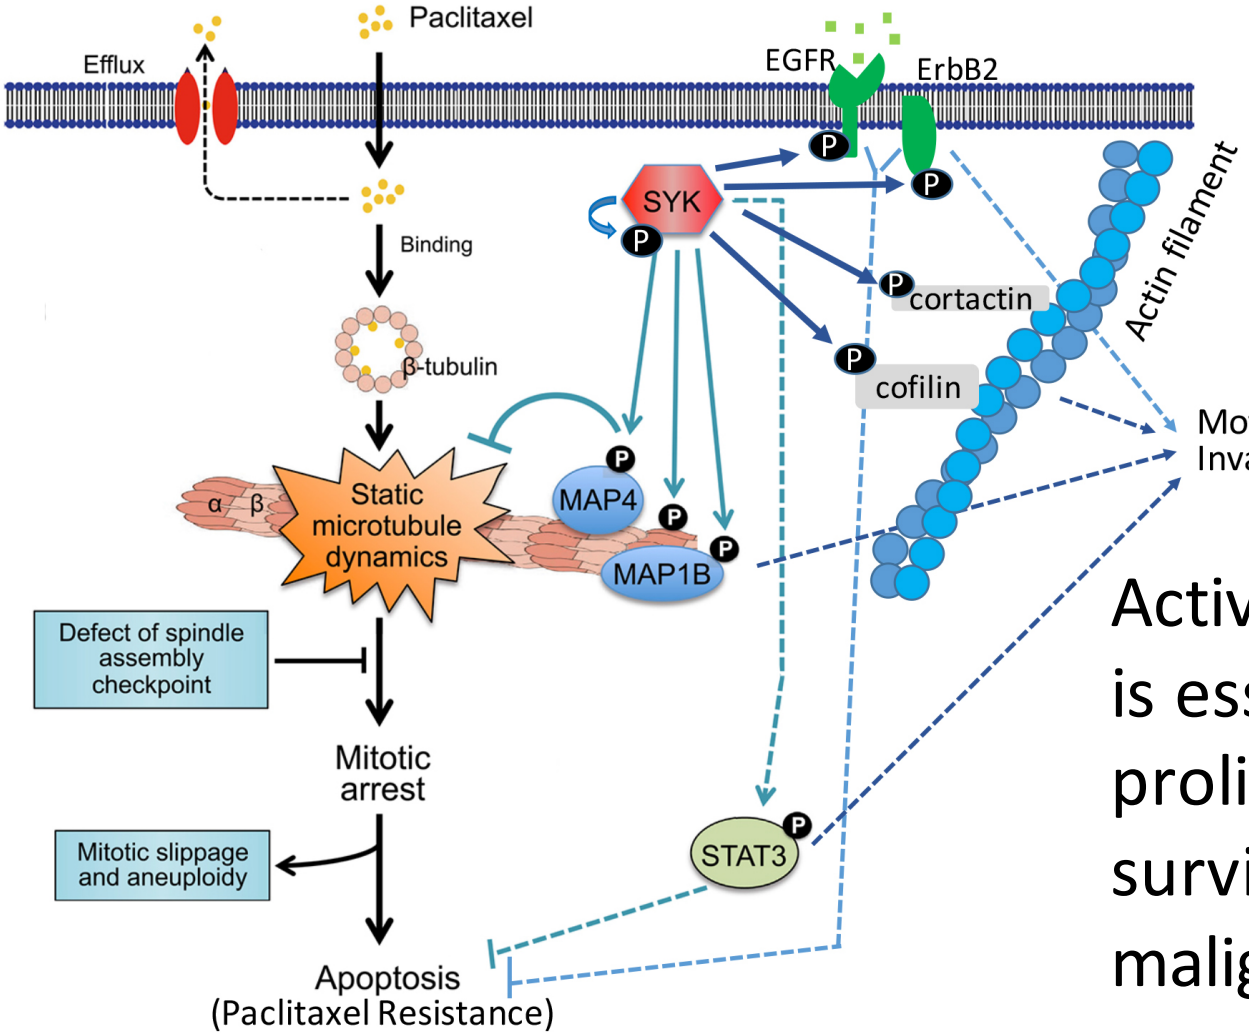
Emerging Pipeline

Targeted therapy and precision cancer medicine based on understanding tumor biology…

- Spleen Tyrosine Kinase (SYK) inhibitor
- Synthetic lethality- ARID1A tumor suppressor
- Immune checkpoint inhibitor
- Others

Spleen Tyrosine Kinase (SYK)

A non-receptor tyrosine kinase mediates signal transduction of transmembrane receptors.



The biological role of SYK in solid tumors remains largely elusive.

Activated SYK signaling is essential for proliferation and survival in B-cell malignancies.

Inhibition of Spleen Tyrosine Kinase Potentiates Paclitaxel-Induced Cytotoxicity in Ovarian Cancer Cells by Stabilizing Microtubules

Yu Yu,[1] Stephanie Gaillard,[1,9] Jude M. Phillip,[3] Tai-Chung Huang,[2] Sneha M. Pinto,[2] Nayara G. Tessarollo,[1,4] Zhen Zhang,[1] Akhilesh Pandey,[1,2] Denis Wirtz,[1,3] Ayse Ayhan,[1,5] Ben Davidson,[6,7] Tian-Li Wang,[1,*] and Ie-Ming Shih[1,8,*]
[1]Department of Pathology and Sidney Kimmel Comprehensive Cancer Center, Johns Hopkins Medical Institutions, Baltimore, MD 21205, USA

- Ovarian cancer cells surviving paclitaxel treatment have higher levels of activated SYK.
- Inhibition of SYK sensitizes ovarian cancer cells (especially TR) to paclitaxel via enhancing microtubule stability.
- This is made possible via altering phosphorylation of MAP1B and MAP4 and tubulins and microtubule-associated proteins.
- Microtubule-independent pathway may also exist.

Leveraging immunotherapy for the treatment of gynecologic cancers in the era of precision medicine

Dmitriy Zamarin [a], Amir A. Jazaeri [b,*]

[a] Department of Medicine, Gynecologic Medical Oncology Service, Memorial Sloan Kettering Cancer Center, United States
[b] Department of Gynecologic Oncology and Reproductive Medicine, University of Texas, MD Anderson Cancer Center, United States

Through biomarker-guided clinical trials, we'll be able to better understand the mechanisms of response and resistance to immunotherapy and develop treatment strategies that will extend the benefit from immunotherapy to a broader range of patients and tumor types.

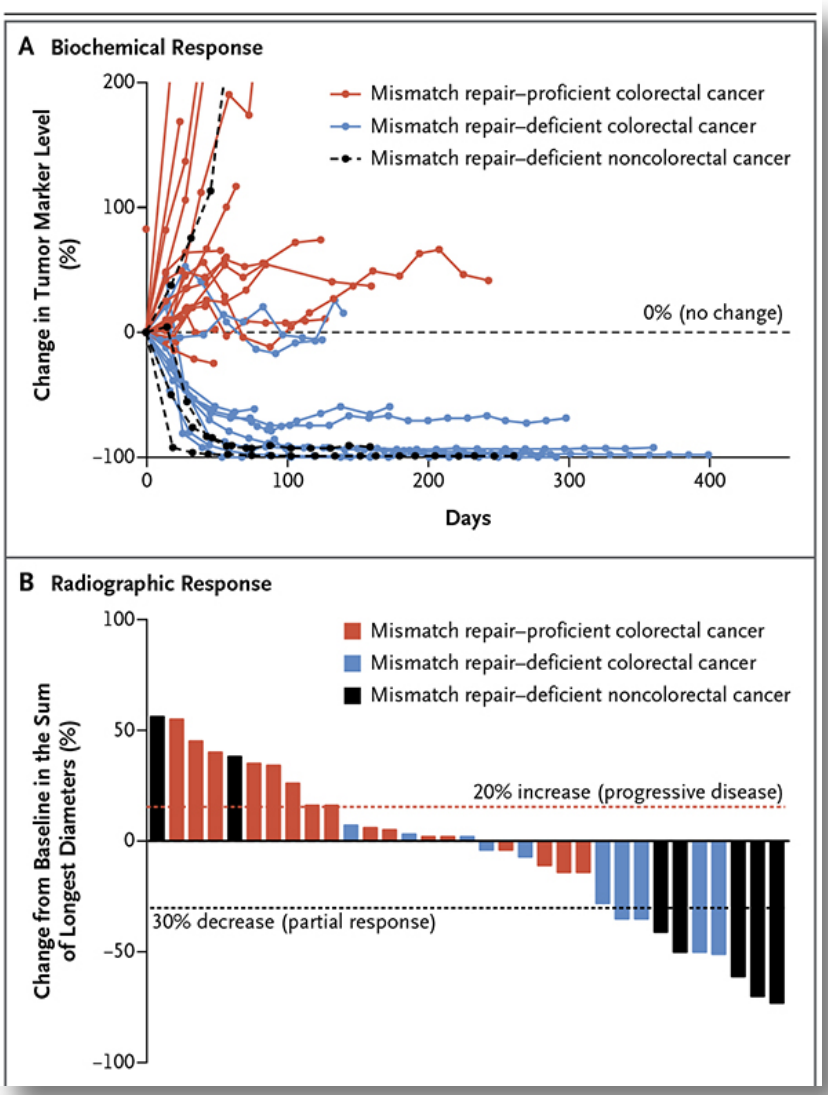
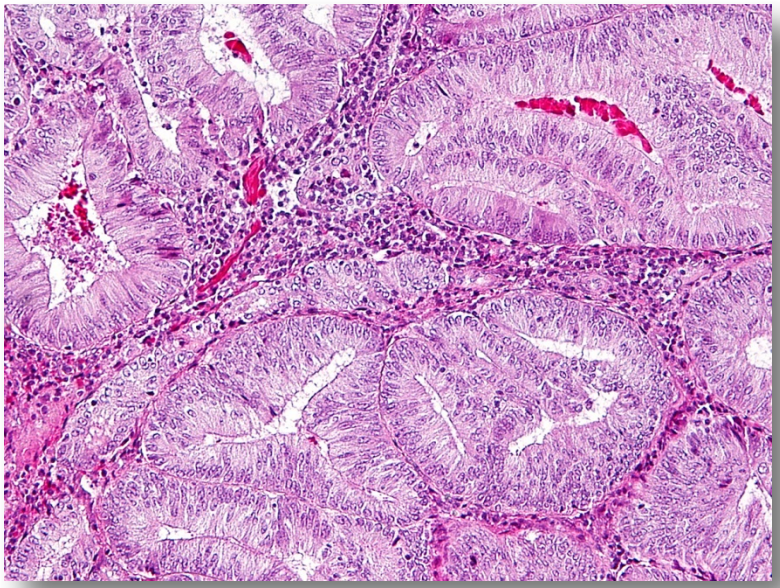
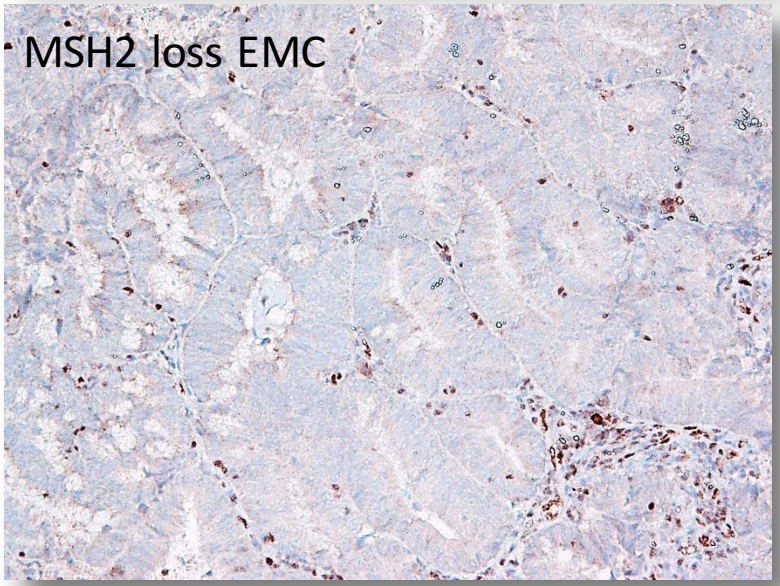
ORIGINAL ARTICLE

PD-1 Blockade in Tumors with Mismatch-Repair Deficiency

Pembrolizumab NCT01876511

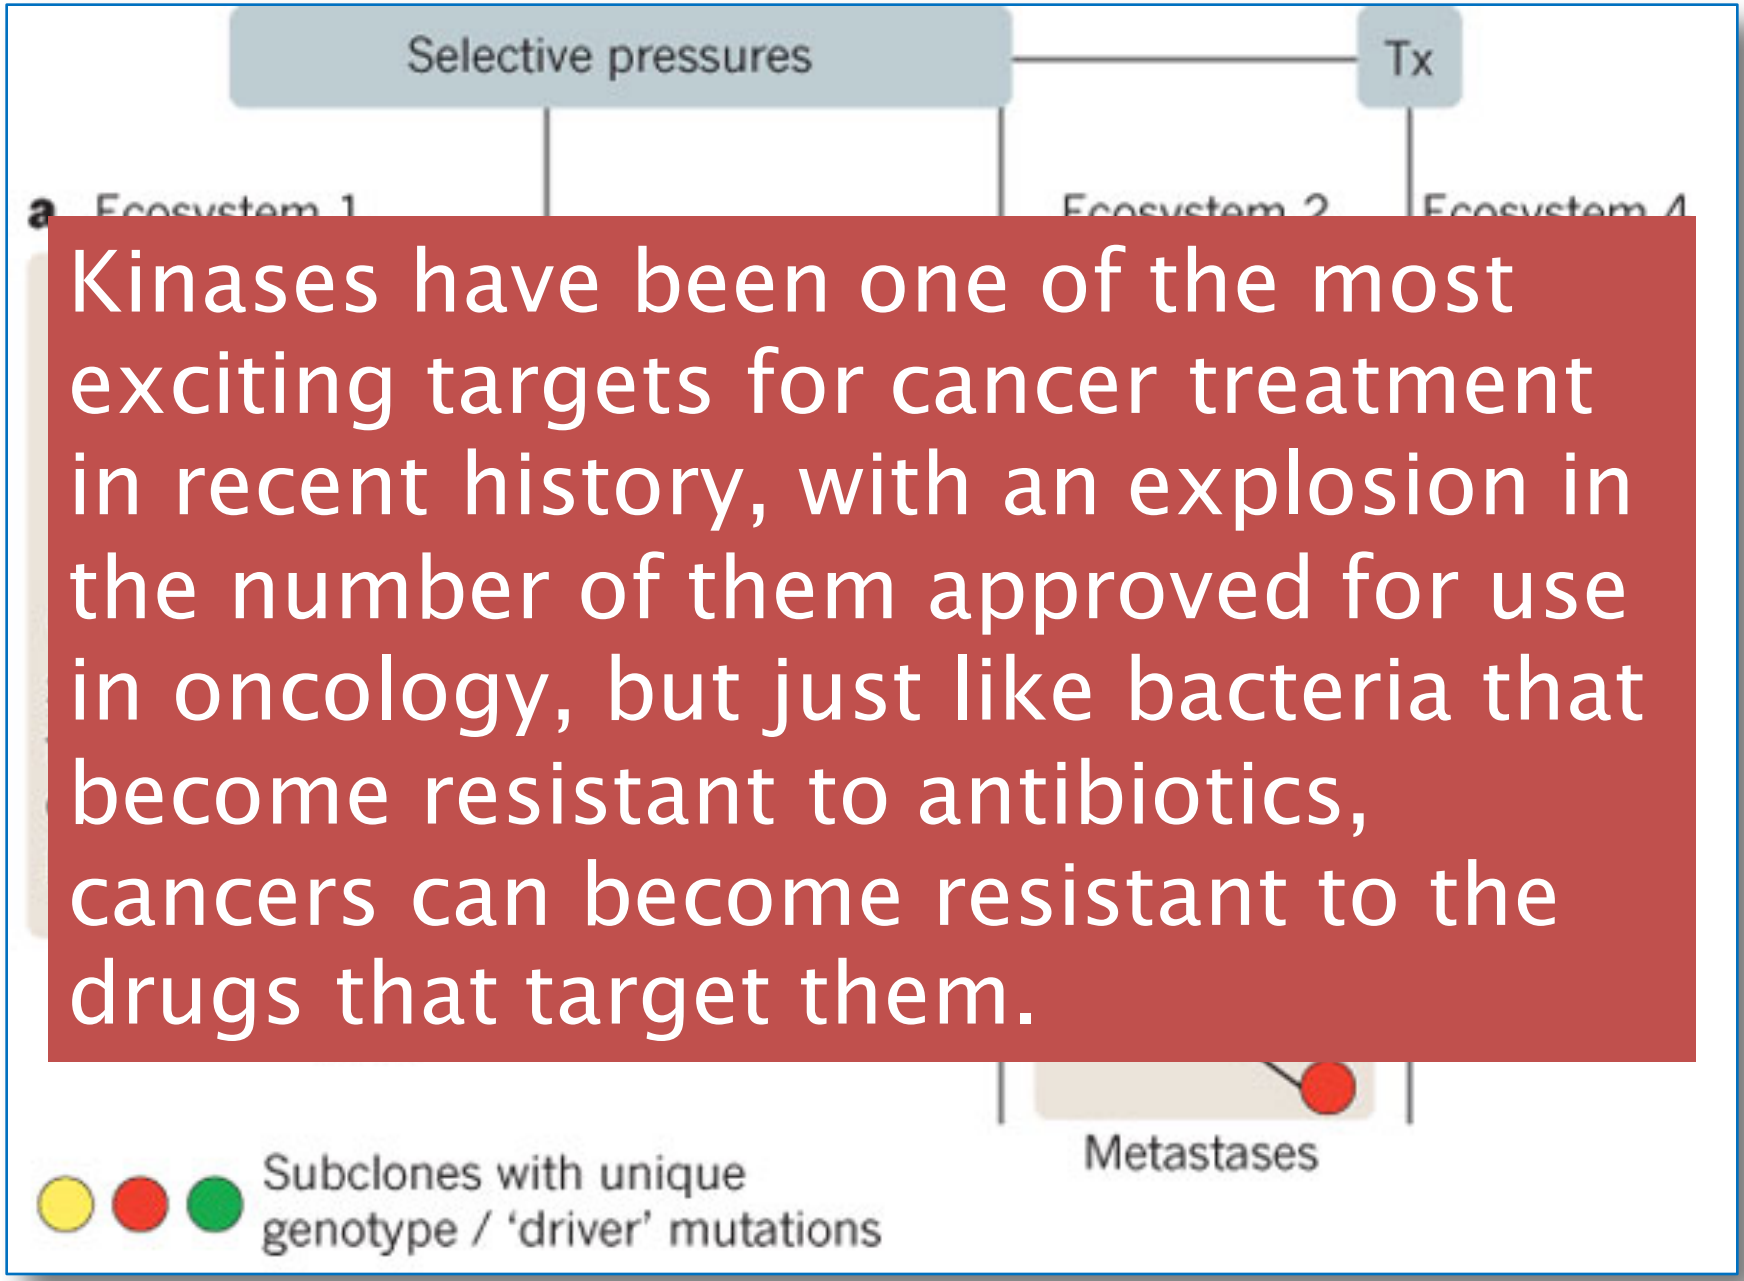






Challenges

- Resistance: Intra-tumoral heterogeneity (tumor evolution driven by Darwinian selection)
- A lot of potential targets but few effective and safe drugs (inhibitors)
- Predictive biomarkers/signatures
- Tumor micro- and macro-environment
- When and how to use?



Kinases have been one of the most exciting targets for cancer treatment in recent history, with an explosion in the number of them approved for use in oncology, but just like bacteria that become resistant to antibiotics, cancers can become resistant to the drugs that target them.

Nature 481:306, 2012

nature medicine

- Intratumoral heterogeneity as a source of therapeutic resistance.
- Majority of resistant clones were part of small, pre-existing subpopulations that selectively escaped under therapeutic challenge.
- Up-front therapeutic combinations that target non-overlapping resistance is a preferred approach?

de novo alterations, in part because of the resolution limits of next-generation sequencing. To address this, we developed a high-complexity barcode library, ClonTracer, which enables the high-resolution tracking of more than 1 million cancer cells under drug treatment. In two clinically relevant models, ClonTracer studies showed that the majority of resistant clones were part of small, pre-existing subpopulations that selectively escaped under therapeutic challenge. Moreover, the ClonTracer approach enabled quantitative assessment of the ability of combination treatments to suppress resistant clones. These findings suggest that resistant clones are present before treatment, which would make up-front therapeutic combinations that target non-overlapping resistance a preferred approach. Thus, ClonTracer barcoding may be a valuable tool for optimizing therapeutic regimens with the goal of curative combination therapies for cancer.

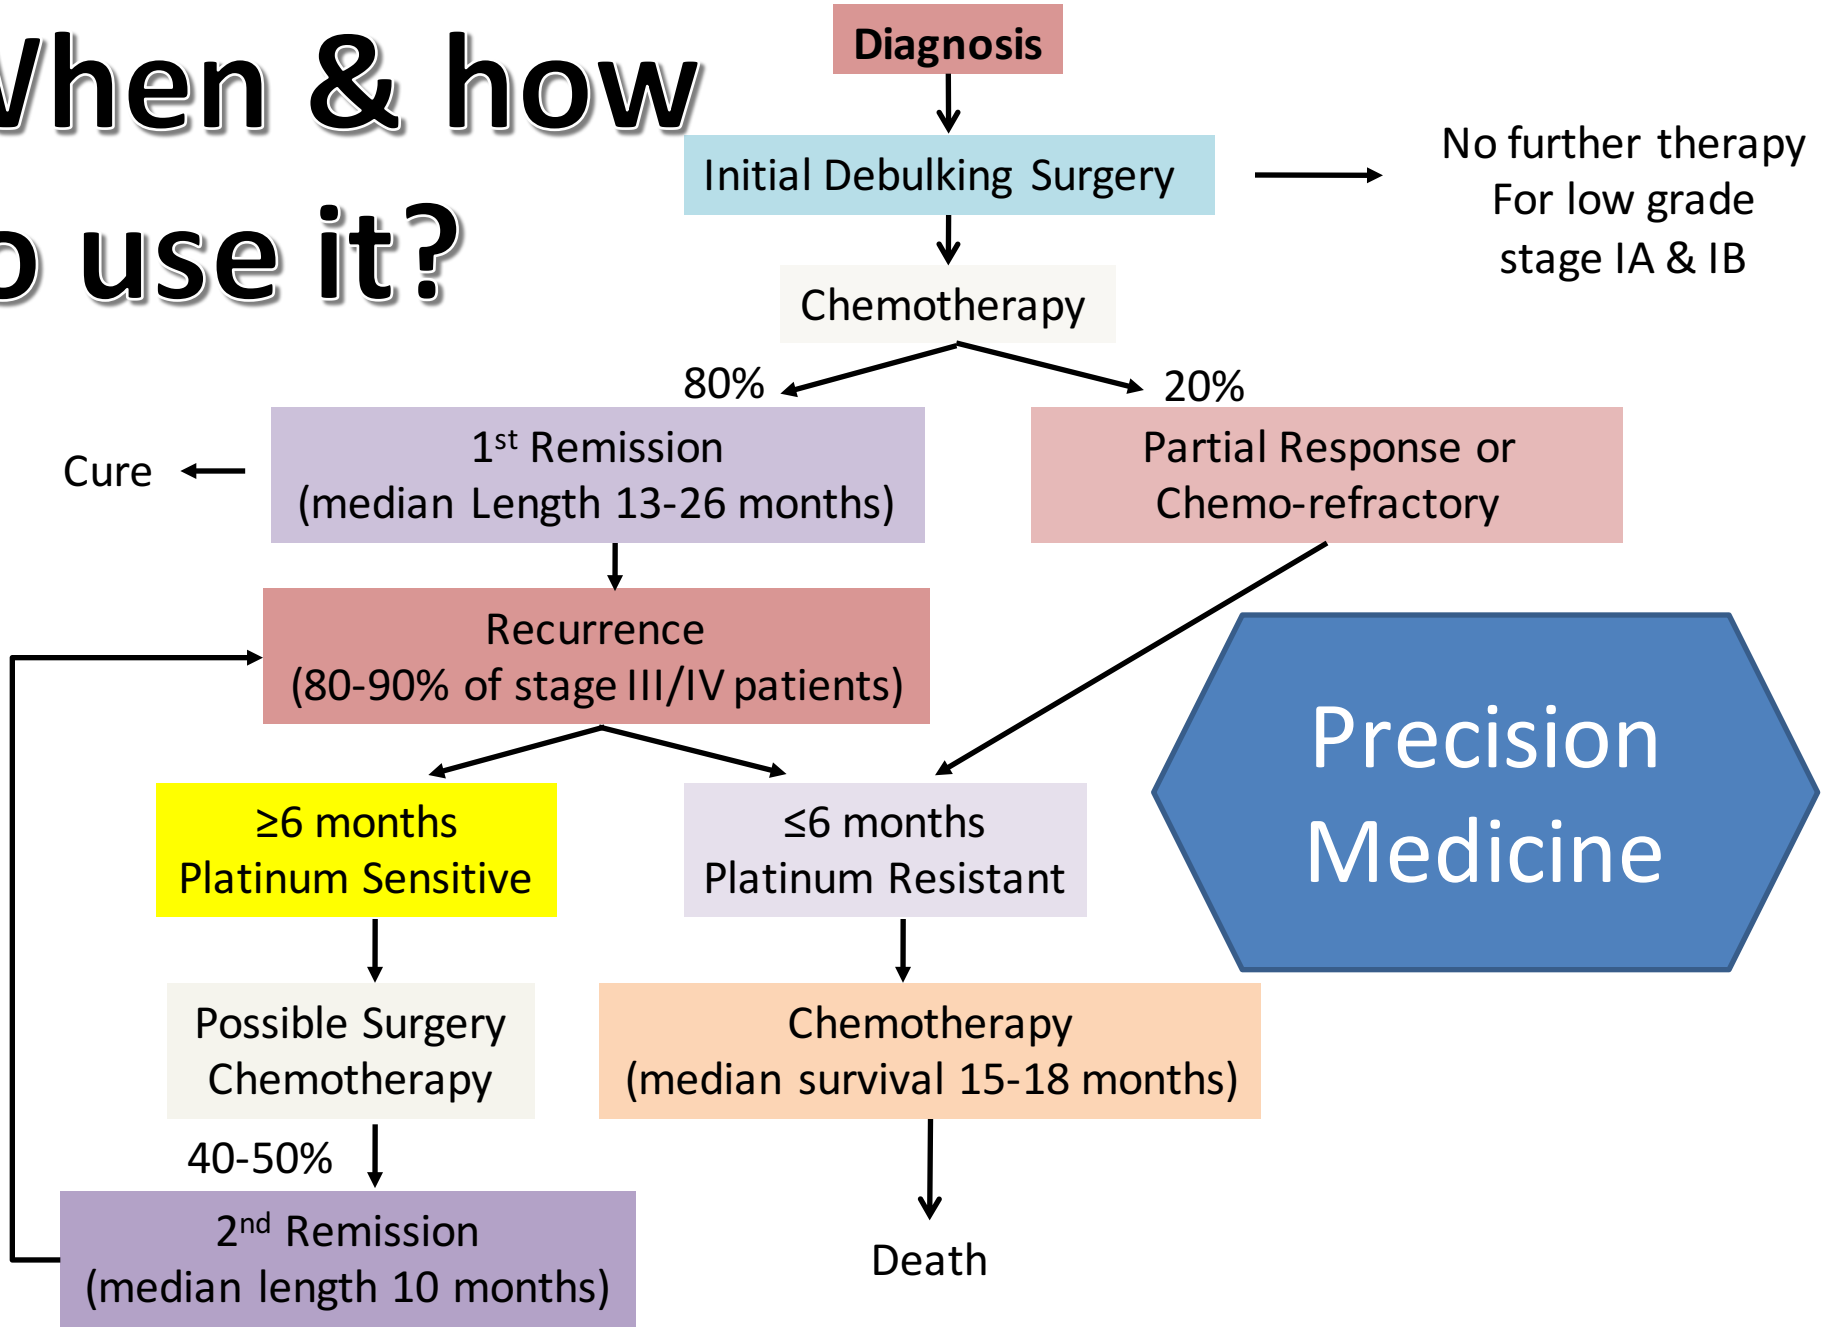
Clinical Utility?

When & how to use it?



"Cancer is no more of a disease of cells than a traffic jam is a disease of cars. A lifetime of study of the internal combustion engine would not help anyone to understand our traffic problems. The causes of congestion can be many. A traffic jam is due to failure of the normal relationship between driven cars and their environment can occur

whether they themselves

are running normally or not."

D.W. Smithers, Lancet, March 1962

Summary- choose your poison
